Operation 22-10-23 and 24-10-2023: Tarsocrural joint (TCJ) arthroscopy (Hasled), septic arthritis.

TCJ RH (Hasled HB): Very irritated and inflamed joint. Moderate amount of fibrin in the joint, both in the dorsal and plantar compartments. Lateral trochlear ridge defect due to OCD removal from previous surgery. Mild partial thickness wear lines (2) on the medial trochlea ridge. Fibrin removed with Rongeurs and shaver. The joint was lavaged with 25 litres ringers. During the second surgery, similar findings were present, but there was only a slight amount of fibrin. Cartilage findings were unchanged from the previous surgery.

The prognosis is good and the operations are not expected to affect the performance of the horse in the future.
